

Brainstorming & Ideation Brief

BOOK STORE MANAGEMENT SYSTEM

1. User Experience Concepts

Traditional book inventories can feel flat or hard to explore. This ideation layout centers on designing a touch-responsive, fluid interface that recreates the physical feel of searching through real bookshelves within a digital environment.

2. Key Innovations & UX Boosts

- **Interactive Book Slices:** Leveraging the touch-responsive capabilities of Swiper.js to establish sliding collection tracks instead of static item listings.
- **Form-Driven Purchases:** Removing messy interface friction by pairing React Hook Form routines with SweetAlert2 notifications for sleek modal updates.
- **Visual Store Metrics:** Swapping out standard data listings with visually rich Chart.js canvas elements to provide admins clean, actionable metrics immediately upon logging in.
